

Technology runbook

One page on how we keep the digital side of the business safe and running. Nothing here needs a technical background — it needs a named owner and a few habits. Review it every six months.

1 • WHO OWNS WHAT

The website, the six site tools, EDM OS and every document are company assets, and two things make that real. First, all source files live in a **private company code repository** — not on one laptop, not only in a zip. Second, anyone who wrote or writes code for us signs a short **IP assignment** putting ownership with EDM Holdings; our solicitor holds the signed copies. Until that signature exists, we're guarding something we don't yet hold on paper.

2 • WHERE SITE FILES LIVE

The tools save their work as files, and files on phones die with the phone. So: every project gets one folder in the company SharePoint, and the rule is **save to the project folder before you leave site**. Structure it the same every time:

Projects / [Project name] / Takeoff · Evidence · Progress · Daybook · Cashflow · Photos

Last person off the job checks the folder is current. That habit is the entire backup strategy, and it costs thirty seconds a day.

3 • HOW THINGS ARE NAMED

The project name is agreed once, at tender stage, and used identically in every tool — the group board links files by that name, so "**Marina Tower**" and "**Marina Twr**" are strangers to it. Wall references come from the takeoff and never change. If the name must change mid-job, change it everywhere the same day.

4 • THE EDM OS PILOT

1. Pick **one live project** — not the biggest, the most typical.
2. Name **one owner** who will live in the system daily. Without this person, don't start.
3. Approve the hosting and hand credentials to the technical lead; setup is about a week.
4. Run it for **thirty days** alongside the current routine: real pipeline, real people, real timesheets.
5. At day thirty, the owner tells the board what to keep, fix, or drop. Then it either goes company-wide or back to the bench — no half-adopted systems.

5 • LOCKS ON THE DOORS

Two-factor sign-in goes on the **domain registrar**, **Microsoft 365 admin** and the **code repository** — those three accounts are the company's digital keys. The website's contact-form key is created under

a company account, never a personal one. One director keeps the master list of who holds which password, and access leaves with anyone who leaves.

6 • IF SOMETHING BREAKS

The design is deliberately hard to kill. The website is plain files — if hosting fails, re-upload the site folder anywhere and it's back. The tools run in a browser with no server, so they can't go down; a lost device costs nothing if the day was saved to SharePoint. EDM OS is the only piece with moving parts, which is exactly why it pilots on one job before it carries the company.
